

IWO resolve-bugs — Cheat Sheet

How to Trigger

Method	Command / Action
TUI	Press b — drops a directive with filter=all, max=10
Shell script	<code>scripts/directive-resolve-bugs.sh [filter] [max]</code>
Manual directive	Drop JSON into <code>docs/agent-comms/.directives/</code>
Desktop launcher	Right-click menu → "IWO: Resolve Bugs" (zenity filter picker)

Directive JSON Format

```
{
  "directive": "resolve-bugs",
  "filter": "all",
  "max_bugs": 10,
  "context": ""
}
```

Filter options: `all`, `critical`, `high`, `approved-only`

Pipeline Flow

```
GitHub Issues (status:approved) → IWO fetches & sorts →
  [Gate if critical/high] → Planner → Builder → Reviewer →
  Tester → Deployer → Docs → label-status:verify → next bug
```

TUI Key Bindings

Key	Action
b	Queue a new resolve-bugs directive
B	Approve a gated bug (critical/high priority)

Human Gate Rules

Priority	Behavior
critical / high	Pauses — press B to approve
medium / low	Auto-dispatches to Planner immediately

What Happens on Completion (per bug)

- GitHub label changes: `status:in-progress` → `status:verify`
- Summary comment posted on the GitHub Issue
- ntfy notification sent to you
- Next bug in queue auto-advances (or gates if critical/high)

Prerequisites

- Bugs must be triaged to `status:approved` on GitHub **before** IWO sees them
- GitHub PAT available via credential-manager (`bw`)
- `claude-agents` tmux session running
- `bugs_enabled: True` in config (default)

Spec ID Format

`BUG-FIX-{issue_number}` — e.g., `BUG-FIX-42`

Single-Sprint Constraint

- Each bug = one pipeline pass (no multi-sprint)
- If Planner decides it's too complex → `outcome: blocked` → recommends creating a proper `EBATT-*` spec instead

Config Fields (iwo/config.py)

```
bugs_enabled           = True
bugs_github_repo       = "ebatt-ai/ebatt"
bugs_max_per_run       = 10
bugs_label_approved    = "status:approved"
bugs_label_in_progress = "status:in-progress"
bugs_label_verify      = "status:verify"
bugs_auto_approve_priorities = {"medium", "low"}
bugs_human_gate_priorities = {"critical", "high"}
```

Troubleshooting

- **"No approved issues found"** → Check GitHub for `status:approved` labels
- **Bug stuck at gate** → Press `B` in TUI to approve
- **Planner not idle** → Another spec is using the Planner; bug queues until it's free
- **PAT retrieval failed** → Run `bw unlock` or check credential-manager
